

# ByteShift Wipe Certificate

Industry-Standard Secure Sanitization Report

---

## Report Metadata

Report ID: 61c3f942-7bb9-4b1c-ae4a-227db0faad22

Generated At (UTC): 2026-05-24T20:36:58.007486Z

ByteShift Version: 2.0

## Wipe Summary

File Name: README.md

File Size: 5,343 bytes

Pre-Wipe SHA-256: 8e924f1a61226757707c9f2a12838d1c8f8f27736b4c5388a1d9a5a99d9018ee

Drive Type: HDD

Wipe Method: HDD 6-pass overwrite (ZERO, ONES, PATTERN\_AA, PATTERN\_55, RANDOM, ZERO)

Pass Count: 6

Wipe Status: DRY\_RUN

Duration: 0.969 seconds

Dry Run: True

Metadata Destroyed: True

Slack Space Cleared: Yes

## Verification Result

Verification Status: SKIPPED

Samples Checked: 0

Passed: 0

Failed: 0

Confidence: 0.0%

Pattern Checked: 0x00

## Advisory Notes

1. JOURNAL WARNING: Filesystem journals (ext4, NTFS, APFS) may retain small metadata fragments or partial file content in journal records. Free-space cycling is available as optional mitigation but is not applied by default.
2. IDENTITY CONTINUITY WARNING: The exclusive file lock was released after the pre-wipe identity hash but before overwrite began. On Windows, this is required because `msvcrt.locking` prevents opening additional file handles from the same process. There is a theoretical (extremely narrow) window where another process could modify the file between hash and overwrite. On Linux/macOS with `fcntl.flock`, this window does not exist because `flock` is advisory and does not block same-process opens. This limitation is documented honestly rather than masked with fragile platform hacks.
3. ByteShift provides industry-standard secure sanitization designed to prevent practical forensic recovery. It does not claim to guarantee impossible recovery against hardware-lab or nation-state attacks.

## Cryptographic Signature

Algorithm: RSA-4096 / RSA-PSS / SHA-256

Payload Hash: 5e00845673e1702e4edba601464b6374e86ca7796b1aaa732e2bc4da7e3891f3

Signature (first 80 chars): 7ed47fbf3a9a17a0da9093749207bd7bc1d256e4095e6375f8961e5084ce78029a46015c9...

---

*This report documents an industry-standard secure sanitization process designed to prevent practical forensic recovery.  
It does not guarantee impossible recovery.*
